The time period for reply, if any, is set in the attached communication.

Office Action Summary

Application No.

10/608,757

Applicant(s)

WANG ET AL.

Examiner

CHARLES D. ADAMS

Art Unit

2164

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 29 November 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-17 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-17 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) ☐ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftperson's Patent Drawing Review (PTO-948)
- 3) ☒ Information Disclosure Statement(s) (PTO/SG/US)
Paper No(s)/Mail Date 11-29-07
- 4) ☐ Interview Summary (PTO-413)
Paper No(s)/Mail Date _____
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: _____

DETAILED ACTION

Remarks

1. In response to communications filed on 27 November 2007, claims 1, 6, 10, and 14 are amended. Claims 1-17 are pending in the application.

Claim Rejections - 35 USC § 101

2. 35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

3. Claims 1-9 and 14-17 are rejected under 35 U.S.C. 101 because, though being claimed as an architecture, on page 60, line 15 to page 61, line 3, the current application describes wherein the server and client are preferably embodied as software. Thus, the claims lack the necessary physical articles or objects to constitute a machine or a manufacture within the meaning of 35 USC 101. They are clearly not a series of steps or acts to be a process nor are they a combination of chemical compounds to be a composition of matter. As such, they fail to fall within a statutory category. They are, at best, functional descriptive material *per se*.

Descriptive material can be characterized as either "functional descriptive material" or "nonfunctional descriptive material." Both types of "descriptive material" are nonstatutory when claimed as descriptive material *per se*, 33 F.3d at 1360, 31 USPQ2d at 1759. When functional descriptive material is recorded on some computer-readable medium, it becomes structurally and functionally

Art Unit: 2164

interrelated to the medium and will be statutory in most cases since use of technology permits the function of the descriptive material to be realized.

Compare *In re Lawry*, 32 F.3d 1579, 1583-84, 32 USPQ2d 1031, 1035 (Fed. Cir. 1994).

Merely claiming nonfunctional descriptive material, i.e., abstract ideas, stored on a computer-readable medium, in a computer, or on an electromagnetic carrier signal, does not make is statutory. See *Diehr*, 450 U.S. at 185-186, 209 USPQ at 8 (noting that the claims for an algorithm in *Benson* were unpatentable as abstract ideas because “[t]he sole practical application of the algorithm was in connection with the programming of a general purpose computer.”).

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sicola et al. (US Pre-Grant Publication 2004/0064639) in view of Mashayekhi et al. (US Patent 6,922,791).

As to claim 1, Sicola et al. teaches:

A data transfer server (see paragraphs [0049] and [0054]);

a primary software agent, hosted on each of said data storage systems, said primary software agent, in communication with the data transfer server, the primary software agent configured for performing data transfer operations in response to commands from the data transfer server (see paragraphs [0049], "storage array controllers", [0058], "remote copy set operation", and [0050], which teaches 'host' and 'disaster-tolerant' paths);

One or more failover software agents in communication with the primary software agent, the data transfer server, and at least one of the two data storage systems, the failover software agents being remote from the primary software agent (see paragraphs [0049]-[0051] and Figure 2. All storage subsystems and all hosts are visible to each other over the SAN. Therefore, as they are connected by various network components, they are remote),

Sicola et al. does not explicitly teach wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems;

Mashayekhi et al. teaches wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51 and Figure 2a. There are multiple ways listed in Mashayekhi et al. which provide for a primary software agent serving as a failover agent for another primary agent);

Sicola et al. as modified teaches:

A failover protocol for determining an order which said software agents, within a communication path of a data transfer, are designated to take over the data transfer operation in response to one or more data transfer commands when a failure of one or more of said software agents is determined, said protocol being determined during configuration of said computer architecture (see Mashaykhi et al. 6:25-38 and 1:58-16).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Sicola et al. by the teaching of Mashayekhi et al., since Mashayekhi et al. teaches that “the implementation of a failover policy can be crucial when considering the overall high availability of a cluster” (see 1:28-30).

As to claim 2, Sicola et al. as modified teaches wherein the data transfer operation is a replication of data within the data storage environment (see Sicola et al. paragraph [0058]).

As to claim 3, Sicola et al. as modified teaches wherein server commands to the software agents are sent over a network in accordance with an IP protocol (see Sicola et al. paragraph [0053]).

As to claim 4, Sicola et al. as modified teaches wherein the software agents communicate with the at least one data storage system over the network in accordance with a Fibre Channel protocol (see Sicola et al. paragraph [0052]).

As to claim 5, Sicola et al. as modified teaches wherein a predetermined hierarchal relationship is followed by the data transfer server to select the order in which the failover software agents are commanded to take over the work of the one or more determined failed software agents (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

As to claim 6, Sicola et al. teaches:

A data replication management server (see paragraphs [0049] and [0054]);

A software agent, designated as primary software agent, hosted on each of said data storage systems, said primary software agent, in communication with at least one of the two data storage systems and the data replication management server, the primary software agent configured for performing data replication operations in response to commands from the data replication management server (see paragraphs [0049]-[0050] and paragraph [0058]);

One or more failover software agents in communication with the primary software agent, the data replication management server, and at least one of the two data storage systems, the failover software agents being remote from the primary software agent (see paragraphs [0049]-[0051] and Figure 2)

Sicola et al. does not explicitly teach wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems;

Mashayekhi et al. teaches wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51 and Figure 2a);

Sicola et al. as modified teaches a failover protocol for determining an order in which said software agents, within a communication path of a data transfer (see Sicola et al. paragraphs [0049]-[0052] and Figure 2), are designated to take over the data transfer operation in response to one or more data transfer commands when a failure of one or more of said software agents is determined, said protocol being determined during configuration of said computer architecture (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Sicola et al. by the teaching of Mashayekhi et al., since Mashayekhi et al. teaches that “the implementation of a failover policy can be crucial when considering the overall high availability of a cluster” (see 1:28-30).

As to claim 7, Sicola et al. as modified teaches wherein server commands to the software agents are sent over a network in accordance with an IP protocol (see paragraph [0053]. An “Internet Link” would inherently use an “IP protocol”).

As to claim 8, Sicola et al. as modified teaches wherein the software agents communicate with the at least one data storage system over the network in accordance with a Fibre Channel protocol (see paragraph [0052]).

As to claim 9, Sicola et al. as modified teaches wherein the data replication management server uses a predetermined hierarchical relationship to select the order in which designated ones of the failover software agents are commanded to take over the work of the one or more determined failed software agents (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

As to claim 10, Sicola et al. teaches a method for managing fault-tolerant resources for replication of data stored in a data storage environment including at least two data storage systems, and wherein data is replicated (see paragraph [0058]) from one of the at least two data storage systems to at least one other data storage system of the at least two data storage systems (see paragraph [0049]), and at least one software agent in communication with at least one data replication management server for managing the fault tolerant resources (see paragraph [0049]), the method comprising:

configuring one or more software agents as failover agents that are in remote communication with another software agent, designated as primary software agent, which is also in communication with the data replication management server, and at least one of the two data storage systems (see paragraphs [0049]-[0051] and [0058])

Sicola et al. does not teach wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems;

Mashayekhi et al. teaches wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51 and Figure 2a);

Sicola et al. as modified teaches establishing a failover protocol for determining an order in which said software agents, within a communication path of the data transfer (see Sicola et al. paragraphs [0049]-[0052] and Figure 2), are designated to take over the data transfer operation in response to one or more data transfer commands when a failure of one or more of said software agents is determined, said protocol being determined during configuration of said computer architecture (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Sicola et al. by the teaching of Mashayekhi et al., since Mashayekhi et al. teaches that “the implementation of a failover policy can be crucial when considering the overall high availability of a cluster” (see 1:28-30).

As to claim 11, Sicola et al. as modified teaches wherein server commands to the software agents are sent over a network in accordance with an IP protocol (see paragraph [0053]).

As to claim 12, Sicola et al. teaches wherein the software agents communicate with the at least one data storage system over the network in accordance with a Fibre Channel protocol (see paragraph [0052]).

As to claim 13, Sicola et al. as modified teaches wherein the data replication management server uses a predetermined hierarchal relationship to select the order in which designated ones of the failover software agents is commanded to take over the work of the one or more determined failed software agents (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

As to claim 14, Sicola et al. as modified teaches:

A data replication management server (see paragraphs [0049] and [0054]);

A software agent, designated as primary software agent, hosted on each of said data storage systems, said primary software agent in communication with at least one of the two data storage systems and the data replication management server, the primary software agent configured for performing data replication operations in response to commands from the data replication management server (see paragraphs [0049]-[0050] and [0058]);

One or more failover software agents in communication with the primary software agent, the data replication management server, and at least one of the

Art Unit: 2164

two data storage systems, the failover software agents being remote from the primary software agent (see paragraphs [0049]-[0051] and Figure 2);

Sicola et al. does not explicitly teach wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems;

Mashayekhi et al. teaches wherein said primary software agent further represents a failover software agent for another of said primary software agents in another one of said data storage systems (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51 and Figure 2a);

Sicola et al. as modified teaches a computer-executable program for carrying out a failover protocol for determining an order in which said software agents, within a communication path of the data transfer (see Sicola et al. paragraphs [0049]-[0052] and Figure 2), are designated to take over the data transfer operation in response to one or more data transfer commands when a failure of one or more of said software agents is determined (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to have modified Sicola et al. by the teaching of Mashayekhi et al., since Mashayekhi et al. teaches that “the implementation of a failover policy can be crucial when considering the overall high availability of a cluster” (see 1:28-30).

As to claim 15, Sicola et al. as modified teaches wherein server commands to the software agents are sent over a network in accordance with an IP protocol (see paragraph [0053]. An "Internet Link" would inherently use an "IP protocol").

As to claim 16, Sicola et al. as modified teaches wherein the software agents communicate with the at least one data storage system over the network in accordance with a Fibre Channel protocol (see paragraph [0052]).

As to claim 17, Sicola et al. as modified teaches wherein the data replication management server uses a predetermined hierarchical relationship to select the order in which designated ones of the failover software agents are commanded to take over the work of the one or more determined failed software agents (see Mashayekhi et al. 6:25-38 and 1:58-16, and 7:42-51).

Response to Arguments

6. Applicant's arguments filed 27 November 2007 have been fully considered but they are not persuasive.

Applicant argues that "contrary to the statements made by the Examiner, it has been shown that Sicola fails to teach or suggest a connection among nodes (agents) of different groups and Mashayekhi fails to provide any teaching to allow

Art Unit: 2164

such a connection. Accordingly, even if the teachings of Sicola and Mashayekhi were combined, the combined device fails to disclose that a primary server in one storage system may also be selected as a failover server in another storage system".

In response to this argument, Examiner notes that Sicola et al. states, "The configuration of system **100** allows for applications using either of the storage arrays **203/213** to continue running given any failure of either fabric **103A/1—B** or either of the storage arrays" (paragraph [0054]). Sicola et al. also mentions that the storage arrays are continuously synchronized (see paragraph [0058]). Thus, in view of paragraph [0054], they are used as backups for each other. Sicola et al. also states "a node is simply a device which has at least one port to provide access external to the device. In the context of the present system **100**, a node typically includes an array controller pair and associated storage array" (paragraph [0045]). In relation to this, see Mashayekhi et al., 1:58-2:12, which describes configurations that may be used in the case of failure of a node. "In the above failover policy, each node in the cluster may failover only to one single node that has been designated prior to the time of failure" (see 2:11-13). A further review of Mashayekhi et al. will reveal other options for handling failover occurrence. As such, the combined teaches of Sicola et al. and Mashayekhi et al. show that it would have been obvious to one of ordinary skill in the art at the time the invention was made to have used a primary server in one storage system as a failover server in another storage system, even distributed among different groups.

Applicant also states that "although it may be argued that Mashayekhi discloses assigning nodes or agents in case of failover, the nodes or agents could be distributed among different groups or agents of different groups. However, in this case, such an interpretation of the combination of the cited references would be implementing a feature beyond that disclosed by either of the references". As noted above, such an interpretation is not beyond the features disclosed in Sicola et al. combined with Mashayekhi et al.

Conclusion

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to CHARLES D. ADAMS whose telephone number is (571)272-3938. The examiner can normally be reached on 8:30 AM - 5:00 PM, M - F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Charles Rones can be reached on (571) 272-4085. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
